Net Zero & MuSIASEM

- Self-intro - Fellowship in land use and societal metabolism
- Work in progress
- Scotland (our policy audience, but contextualized by UK) has a goal for net zero by 2045
 - How will this happen? Talk? and the walk?
 - Net zero means offsetting... & mention of afforestation (peatlands too) and carbon capture technologies
 - But not my critique at this point

Net Zero & MuSIASEM

- It would be nice to compare Scotland to other places, but even Scotland is not consistent within itself
- We want multi-year too, but one step at a time
- The focal scale: start where we can (the data) and define where we end – much is data determined
- And go global?
- Grammars
- Why does all this matter? Let's see...

Net Zero & MuSIASEM

- What is this? MuSIASEM? Multi-Scale Integrated Analysis of Societal and Ecosystem Metabolism
- Think: Russian dolls...
 - Successive embeddedness (vertical & horizontal)
 - Spatial/regional/national, sectoral, temporal (always 'multi') -
 - Holon: everything has parts and is part of something else
 - The black box... and 'unblackboxing'

Societal Metabolism?

Societal Metabolism?

Societal Metabolism?

- Absolutes and relative values
- Differential impacts of sectors and qualitatively different from each other

Discussion

- What about Scotland? The detail is not in the data.
- We can glean proportions from UK, but we know it's different, ie, AG and grazing land are different
- AG – low value, low employment, large area, small energy sector and might be small but it's a different policy environment than say commercial
- So, yes, metabolics is hard: need hold multiple pieces of information in head at same time. Multi-sector, multi-unit, non-equivalent items
- Kahneman's Systems 2 thinking – not easy, but more representative of socioecological systems

Discussion

- Systems in government are not set up for metabolic analysis; they're set up for economic analysis, and generally everything gets reduced to pounds – this is not working
- This universal currency gives us sloppy grammars
- In the end, we can't externalize, climate change is witness to that.
- Problem shifting (sweep under rug); EU can't feed itself, externalizing emissions, China gets blamed
- Metabolic can analysis tracks all this... (well, tries!)

Thanks for listening...
